We can finally say "Hallowm" also in Zeta.

In coordination with yellowTAB and the Universitat Rovira i Virgili, Oliver Ruiz Dorantes has completed the initial version of an exciting new application for Zeta.

Whisper is based on BeNet, and is an VoIP application that uses open standards for maximum network interoperability and integration. It promises to enhance the experience of Zeta users wanting to communicate over the Internet.

Popular applications such as Microsoft NetMeeting and GnomeMeeting also support the H.323 standard allowing for cross platform use of the technology.

This application will come standard with Zeta Deluxe and has been fully integrated to work seamlessly with Zeta's multi-language system.
